

Dentto-DamTM

Light-cured liquid dam for gingival protection and rubber dam sealing

Precise isolation
Easy removal

Various indications

Perfect sealing: Prevents contact between bleaching and etching agents and gingival tissue.

Crown or pulp wall formation: Creates an isolation barrier during endodontic treatment.

Easy application

Excellent flow: Penetrates and seals interproximal areas and gingival sulcus.

Vivid color: Allows clear visual identification for precise application.

Dentto-Dam™

Reliable protection, perfect sealing, and easy removal — ensuring accuracy and comfort in every procedure.

Dentto-Dam™ is a light-cured composite resin-based gingival barrier with a vivid blue color. During rubber dam placement, it provides a secure seal around the gingiva and adjacent areas, effectively preventing bleaching agents, etchants, and air-abrasion powders from contacting surrounding tissues. During professional tooth-whitening procedures, it safely covers the gingiva to minimize irritation and tissue damage caused by chemicals, while its excellent flow enables precise application even in detailed areas such as interproximal spaces and the gingival sulcus. In addition, it can be easily removed in one piece, greatly enhancing clinical efficiency and convenience.

Indications

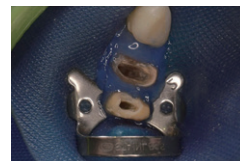

- Gingival isolation from whitening agents during professional bleaching
- Protection of gingiva from irritants such as etching agents and air-abrasion powders
- Auxiliary sealing during rubber dam placement

Clinical Case

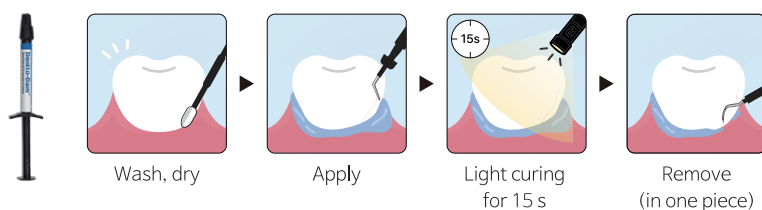

- Gingival protection during tooth whitening

- Rubber dam sealing
